Password control system, password control method, information processor and computer program

Abstract
(JP2003085143)
PROBLEM TO BE SOLVED: To provide a password control system capable of securely and efficiently controlling a plurality of passwords
SOLUTION: A master password is set as a superordinate password of the passwords set in an information processor, and coincidence of the master password is verified at resetting or changing processing time of the respective passwords. The master password is generated by cipher processing by applying a master key to device ID, and is not stored in a memory, and is generated when executing coincidence verifying processing. A support center is set for controlling the master password, and is constituted so as to execute master password reissuing processing to reduce a burden of password control in a user.
